

ULAB Physics and Astronomy

Python Advanced 3

Due: October 31, 2021

For Python Adv. module 3, your only task is to take everything you had in your Jupyter notebook and put it in a Python file! So open the whichever text editor you use (some options are Atom, Sublime Text, PyCharm) and simply copy over the functions necessary to build your double pendulum to a .py file.

Good luck and reach out to us if you have any questions in the #questions channel!
